

ABSTRACT OF THE DISCLOSURE

Please cancel the original Abstract and replace it with the following new Abstract.

An arrangement for practicing dentistry includes a model tooth detachably mounted in a model base. The model tooth includes a crown part, a root part extending axially away from the crown part, and a fixing part extending axially away from the root part. The fixing part includes a cylindrical shaft and a radially enlarged head that is divided into a plurality of head portions resiliently movable relative to each other. The fixing part is received in a mounting passage in the model base with a snap-type locking action.
